

FRONT END – PART 1

INTRO TO CSS

Chaining Selector for Heading

Now we will see how we can use chaining selectors.

Suppose we need to apply a style to the different headings of our page, so it's logical to use the same class name for all the headings.

So, add class "h-style" to the remaining headers of the blog page.

Now, apply different font family to these headings using the class only.

Below are the basic font styles to be added -

ELEMENT	FONT FAMILY
<code><h1></code>	sans-serif
<code><h4></code>	monospace

Also, increase the text size of all the `<h4>` tags to '1.33rem'.

Also, increase the text size of all the `<h4>` tags to 18 pixels.
