FRONT END – PART 2
OBJECTS AND TIMING EVENTS

(Property Exists)

Implement a function propertyExists(obj, path) that takes two arguments - an object and a path (string). It returns 'False' if the property is null or it doesn't exist for that object, otherwise it will return the value of the property for that object.

Note: Properties can have single character only. So, path can be a string with concatenation of many properties.

Sample Input :

1 {"a":{"b":"dadsa"}} ac

Expected Output :

false

Sample Input :

2

{"a":{"b":"dadsa"}} ac

{"a":{"b":"dadsa"}} ab

Expected Output :

false

dadsa
